Air avg rolling volatility

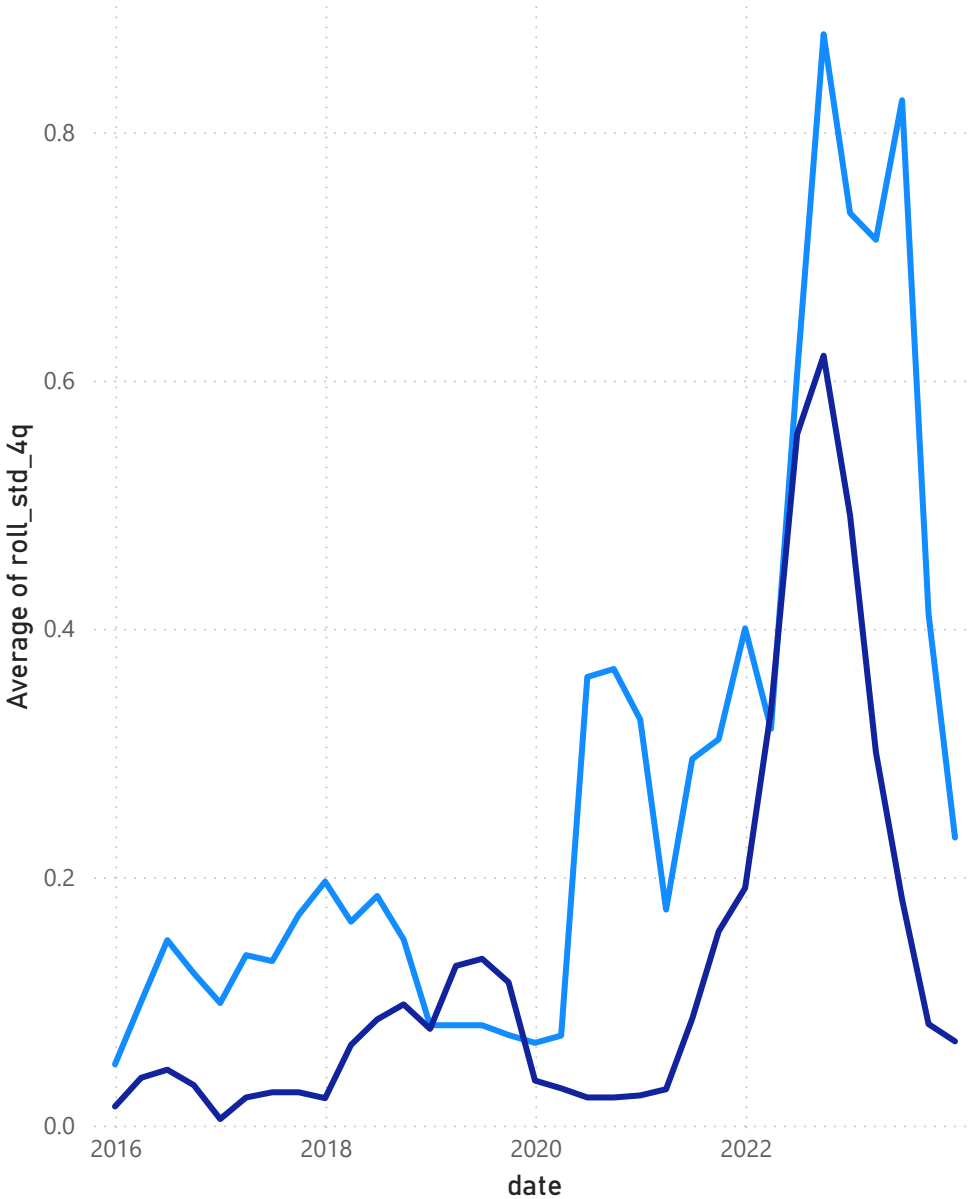

Air vs road price index (2021=100)

mode ● air ● road

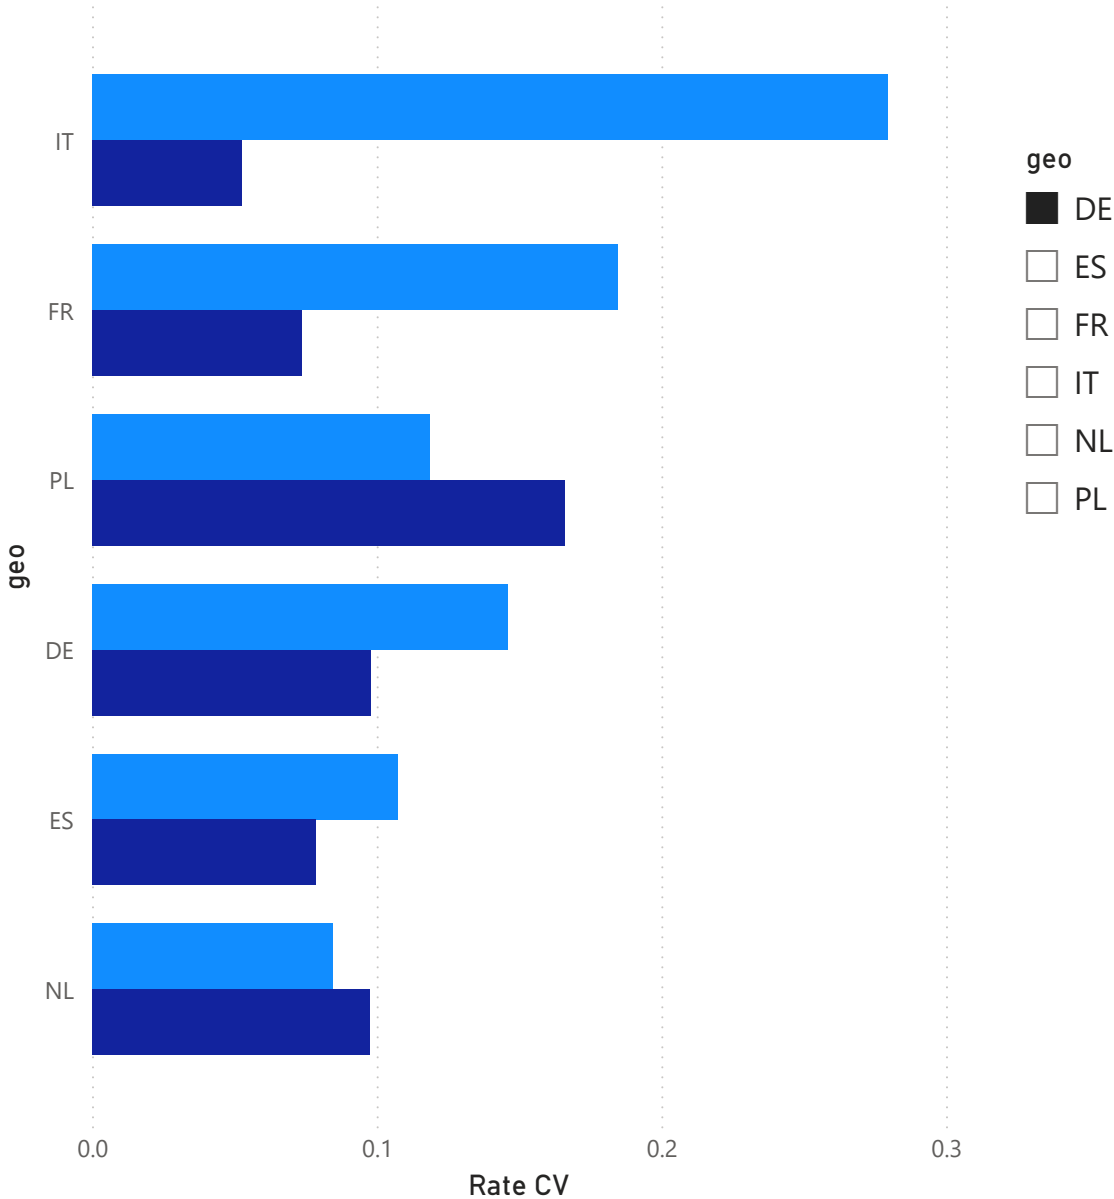

Rolling 4Q volatility (air vs road)

mode ● air ● road

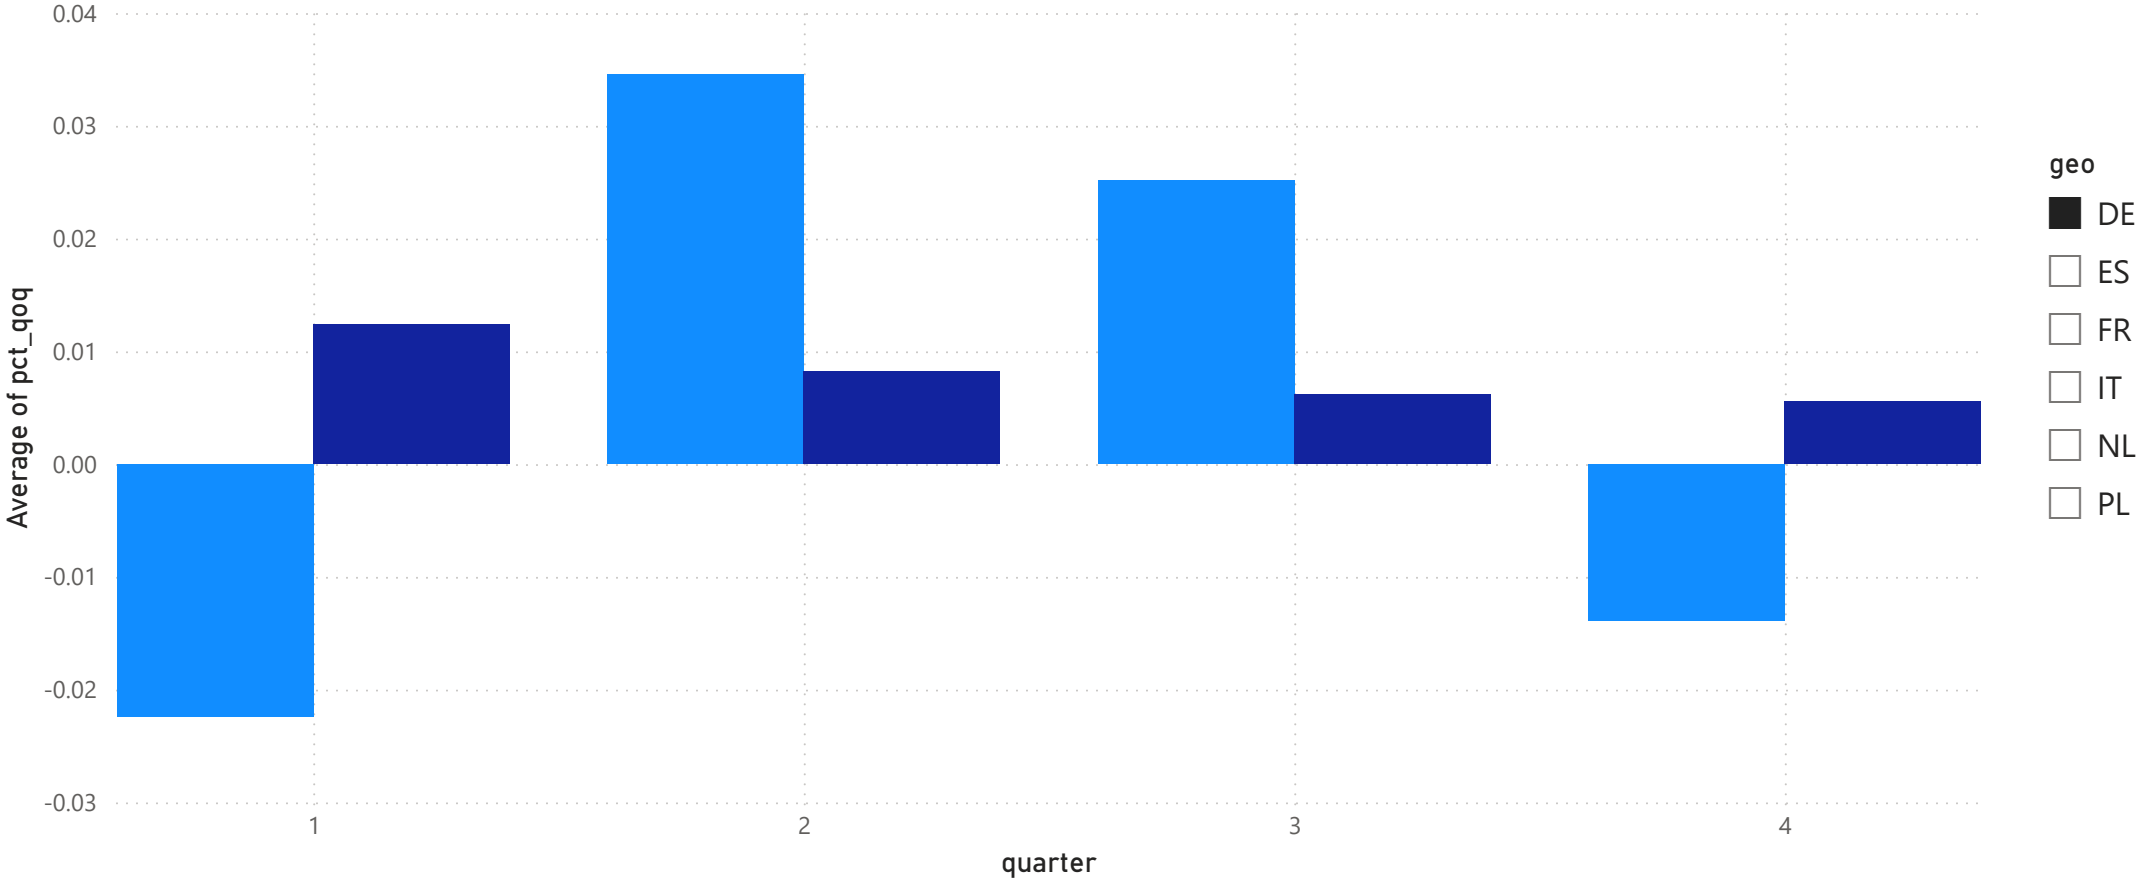

Rate CV by country (air vs road)

mode ● air ● road

Quarter-on-quarter change by quarter (air vs road)

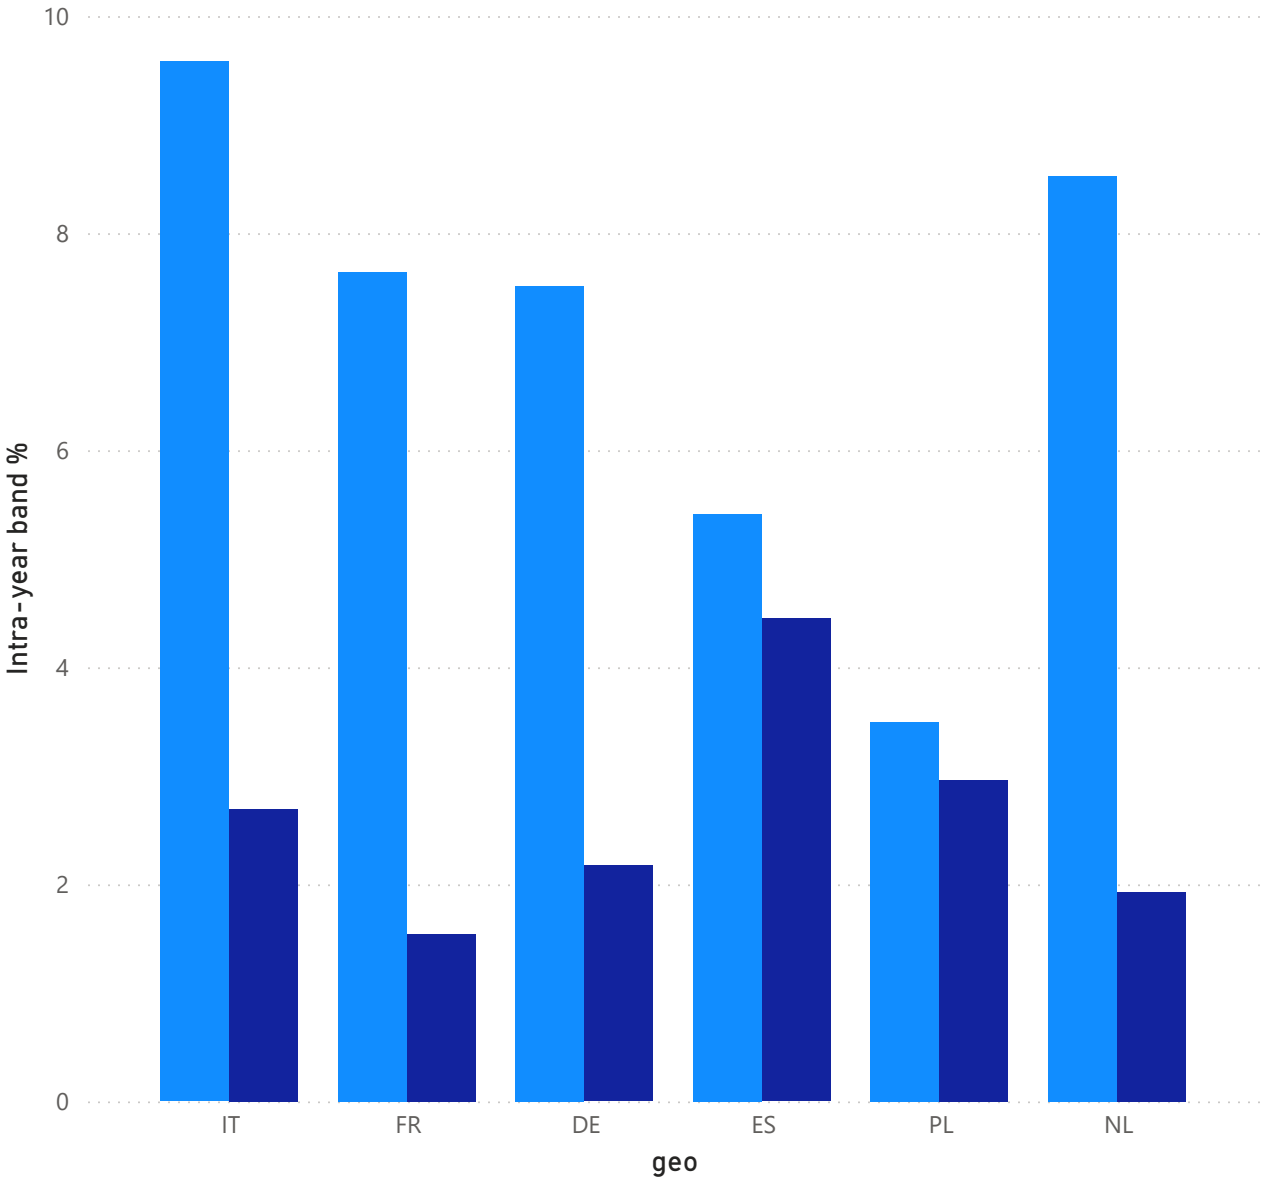

mode ●air ●road

Kruskal-Wallis quarter effect: air p approx 1e-10, road p approx 5e-4. Both modes seasonal, peak in Q2. Lock air rates ahead of the Q2 high season.

Intra-year rate band by country (air vs road)

mode ●air ●road

751.18K

Euro exposure

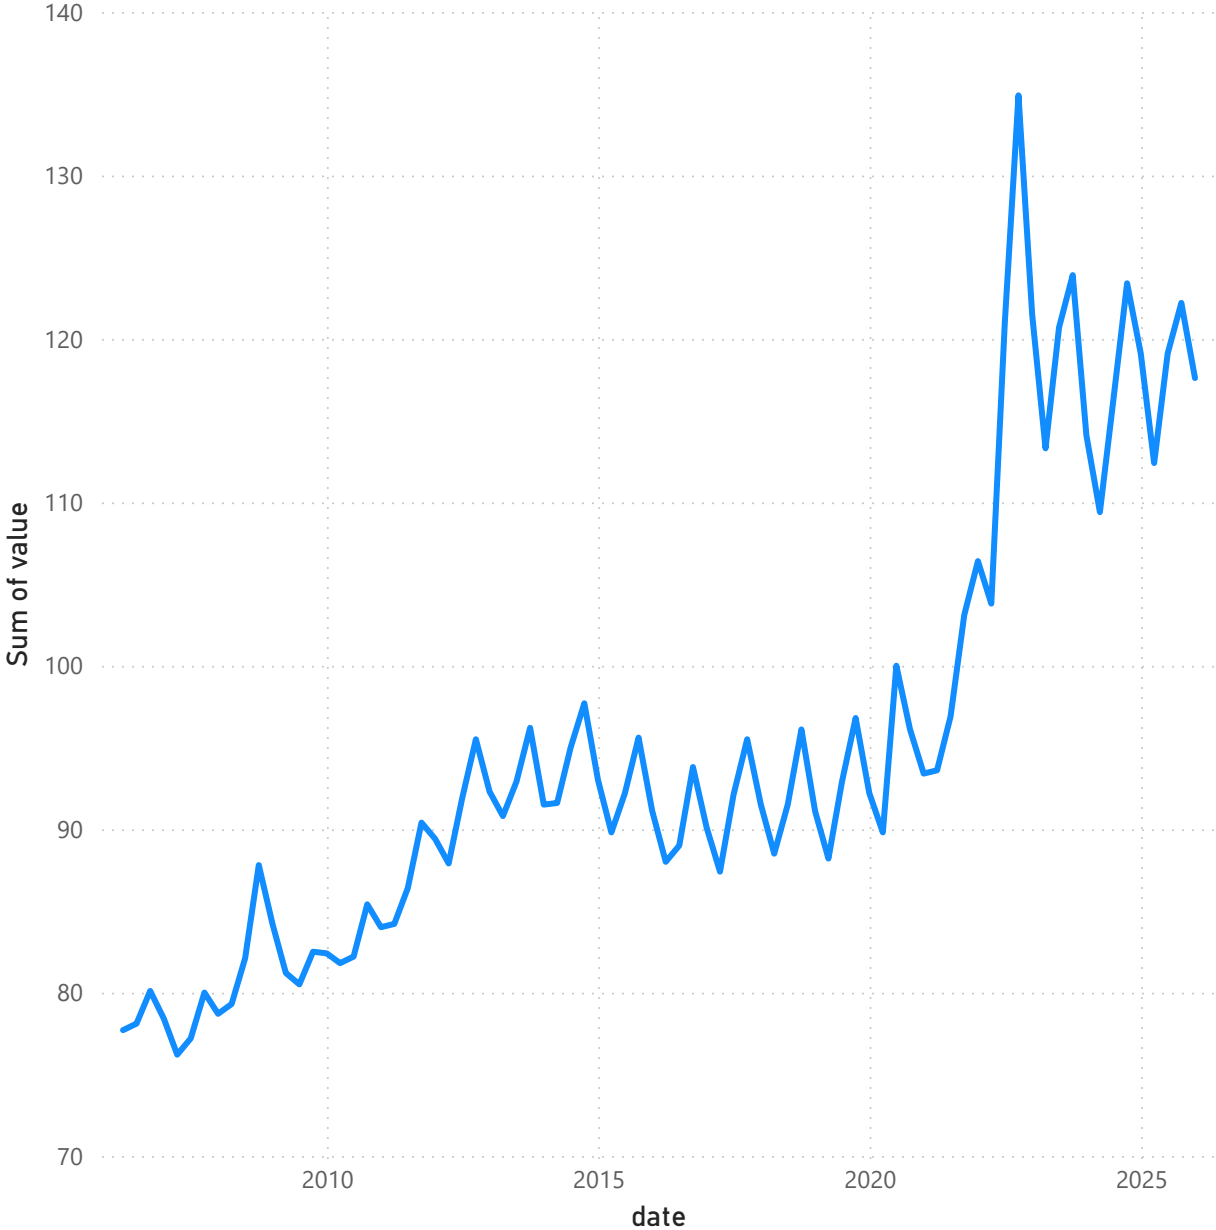

Air spend

10000000

Euro exposure = intra-year band % x annual air spend.
Move the slider to set your air spend. Pick a country in the slicer to size that lane. This is the budget range to hold for air rate swings.

EU27 air index, long history (NACE H51, 2021=100)

Data, method, and limits

Source: Eurostat SPPI, quarterly, 2021=100. Road = NACE H49.4 for all six. Air = Eurostat NACE H51 for DE, IT, ES, NL, PL. French air = INSEE CPF 51.21 (air freight only).

Method: z-scores, rolling 4Q standard deviation and CV, Levene variance test, Kruskal-Wallis seasonal test. Each visual is backed by a test.

Limits

- H51 includes passenger air. Read the five H51 air lines as a broad air-rate proxy, not pure freight.
- French air is freight only (CPF 51.21), the purer definition. Part of France's high air rank reflects the source, not only a real gap. State this in the defence.
- Road has no EU27 aggregate. Cross-mode comparison runs at member-state level only.
- The set is six states: DE, IT, ES, NL, PL, FR. The common window ends 2024-Q1.
- Indices show rate tendencies, not realised savings.
